Wardrobe Manager

Comprehensive System Specification & Operations Guide

Extension Technical Documentation

November 9, 2026

Abstract

The **Wardrobe Manager** is a specialized browser extension designed to extend member functionality across multiple Vinted country domains. It introduces advanced inventory search, multi-metric sorting, bulk listing management, local snapshot backups, analytics tracking, and automated safe relisting through a private draft workflow. This document details the architectural design, feature matrix, API operational flows, safety mechanisms, installation guidelines, and technical limitations of the system.

1 System Overview & Core Capabilities

The extension integrates directly into the member interface to streamline wardrobe operations without publishing drafts automatically or bypassing security controls.

- **In-Page UI Injection:** Appends a dedicated *Relist as draft* action adjacent to existing *Booster* and *Bump* actions on item cards and individual item focused views.
- **Wardrobe Management Dashboard:** Features an interactive overlay displaying items grouped into dedicated status buckets (*On sale*, *Drafts*, *Hidden*, and *Sold*).
- **Robust Wardrobe Pagination:** Traverses every available wardrobe page during initialization to ensure accurate status classification before applying filters.
- **Safe Relisting Pipeline:** Fetches existing listing details and original assets, uploads media, creates a private draft listing, and optionally deletes the original listing post-verification.
- **Snapshot & Backup Synchronization:** Maintains local state for successfully relisted items, auto-synchronizing records against active listings and cleaning up upon confirmed item sale.
- **Adaptive Multi-Domain Support:** Automatically resolves endpoint base URLs dynamically using host origin parameters (`location.origin`), supporting all major Vinted top-level domains (TLDs).

Table 1: Module Breakdown and Feature Scope

Module	Functionality Description
Items Manager	Title search, multi-field sorting (date, price, views, favourites), status filtering, floating launch menu with edge-docking memory.
Relist Engine	Automated photo download/re-upload, field cloning (brand, size, price, category), configurable delays (fixed or randomized ≥ 6s), draft-first safety guarantee.
Bulk Operations	Sequential execution for relisting, exact/percentage price edits (e.g., `+10%`, `=12.00`), hiding, unhiding, and listing deletion with live progress display.
Analytics	Local snapshot aggregation, inventory valuation metrics, selling-potential ranking with item thumbnails, and persistent engagement history views.
Logging System	Circular storage keeping up to 300 operation entries with precise timestamps, status results, detail copying logs, and export capability to JSON.

2 Feature Specification Matrix

3 Technical Architecture & Security Model

3.1 Component Breakdown

The extension adheres to standard WebExtension standards utilizing content script injection, background service workers, and local storage management:

1. **Content Script (`content.js`):** Renders in-page overlays, parses current DOM context for inline tokens, handles dragging logic for the launcher UI, and interfaces with the injected shadow elements.
2. **Background Worker (`background.js`):** Monitors network traffic via request headers on target domains to capture authentication and CSRF tokens (`x-csrf-token`, `x-anon-id`).
3. **Manifest Configurations (`manifest.json`):** Specifies multi-domain host permissions, script matching, and explicit permission declarations.

3.2 Permission Declarations

- `activeTab`: Required to launch the in-page management UI from the toolbar popup.
- `scripting`: Allows injection of script modules dynamically across target pages.
- `webRequest`: Enables header observation for seamless authentication context capture.
- `storage`: Persists configuration settings, activity logs, and listing snapshots locally in `chrome.storage.local`.

4 Relisting Workflow & Safety Protocols

1. **Initiation & Verification:** The user selects single or bulk items. The system verifies that target items are strictly in the *On sale* state (preventing accidental processing of *Sold* inventory).

2. **Asset Extraction:** Item field metadata (title, description, price, brand, size, category) and original image URLs are retrieved.

3. **Pacing & Rate Limiting:** The pipeline inserts bounded delays (1.0 – 1.5 seconds) between image transfers. Overall operations adhere to configured pacing budgets (minimum 6-second enforced minimum on randomized intervals).

4. **Draft Creation:** Images are uploaded and a private draft is initialized. The system **never** invokes draft publishing endpoints.

5. **Deletion Handling:** If enabled, the original listing is deleted *only after* successful draft creation. If deletion fails, the draft remains accessible and an explicit error report is generated.

5 Supported Country Domains

The system supports cross-border Vinted operations across a broad set of country-specific domains:

Western Europe	**Central Europe**	**Eastern / Southern**	**Nordics / Other**
France (`.fr`)	Germany (`.de`)	Poland (`.pl`)	Sweden (`.se`)
Italy (`.it`)	Austria (`.at`)	Czech Rep. (`.cz`)	Norway (`.no`)
Spain (`.es`)	Switzerland (`.ch`)	Slovakia (`.sk`)	Finland (`.fi`)
Portugal (`.pt`)	Netherlands (`.nl`)	Romania (`.ro`)	Denmark (`.dk`)
Belgium (`.be`)	United Kingdom (`.uk`)	Greece (`.gr`)	International (`.com`)

6 Installation & Deployment

6.1 Extension Installation

1. Open the extension manager in your Chromium-based browser (`chrome://extensions` or `edge://extensions`).

2. Enable **Developer mode** using the toggle switch.

3. Select **Load unpacked** and choose the project directory containing `manifest.json`.

6.2 Operational Instructions

– Navigate to any supported member wardrobe page (e.g., `https://www.vinted.de/member/<id>`).

– Click the extension icon and select **Open wardrobe manager** or use the floating page launcher.

– For price updates, use expressions such as `+2`, `-1.50`, `+10%`, `-15%`, or explicit targets like `=12.00`.

7 Known Limitations & Operational Constraints

- **Anti-Bot Countermeasures:** Anti-bot screens (e.g., Cloudflare, DataDome) or 403 responses require manual user intervention or page refresh.
- **Local Storage Boundaries:** Snapshots are stored within browser-managed local storage (`chrome.storage.local`) rather than filesystem directories due to web platform security constraints.
- **Experimental Endpoints:** Hide/unhide capabilities rely on internal APIs and require secondary user confirmation prior to execution.
- **Financial History Scope:** Balance history and full sales logs remain restricted to default platform feeds; analytics metrics are calculated strictly from active extension observations.
